The background is a dark blue gradient filled with a pattern of white and light blue binary code (0s and 1s). Overlaid on the left side are several thick, curved, light blue lines that sweep across the frame from the top left towards the bottom right.

Do your
existing safes
work risk-free?

With a customized concept especially adapted for your branch processes, **Lock4Safe** transforms your existing safes into smart safes of the present.

„Those who do not invest in the smart way, will not be able to survive in the long run.“ Almost every company is forced to re-evaluate their processes and to invest in smart and innovative security solutions. Sustainability and opportunities to prevent losses are more important than ever before ...

Increasing and incalculable costs of service and internal thefts are mostly caused by the human factor. **This also includes incorrect or malicious handling of your safes.**

In principle: A good quality safe remains being a quality safe, even after years of usage. This has only one purpose: to keep your money risk-free.

You as a customer can determine how intelligently your safes work: by selecting the right safe lock, combined with the skills of the user who knows how to operate with it the right way.

Do your existing safes really „work“ risk-free?

Retrofit _{your} safes
often better than
buy new ones!

Safe manufacturers are saving costs to reach their economic success. Often on the materials used for production. Therefore, it is questionable that new safes will be of better quality than your old (existing) ones.

Do not underestimate the costs for **disposal** of the old safes. Due to mixed materials, metals, concrete, heat absorbing fillings, sometimes even asbestos, the costs can be substantial.

If your existing safes are still fully functional, it is more **sustainable** to continue using them.

In most cases it is possible to **retrofit your safes** with just a new safe lock system that is **adapted for your branch processes**. Therefore Lock4Safe is your competent service partner.

Better buy a lock directly from the safe manufacturer?

You should be aware of the following: The priority for safe manufacturers is to sell safes. They install the lock system the customer selects. Due to that fact, the manufacturer is not interested in depth advice regarding the safe lock.

... and, have you thought about who will train your staff on the new system?

... because a safe (lock) is only secure if the owner/user knows how to operate it!

Key locks

support ...

Smart safe locks

minimize ...

... possibilities for
internal thefts!

From the mechanical point of view, a key lock is considered just as „secure“ as an electronic safe lock. The difference between these two types of locks makes the human handling. When you are owner of a safe with a key lock, you should know that the safe brings a high level of security risks with it.

The key lock

With a key lock based safe there is no clearly defined responsibility for the safe and the key is simply passed on by the staff.

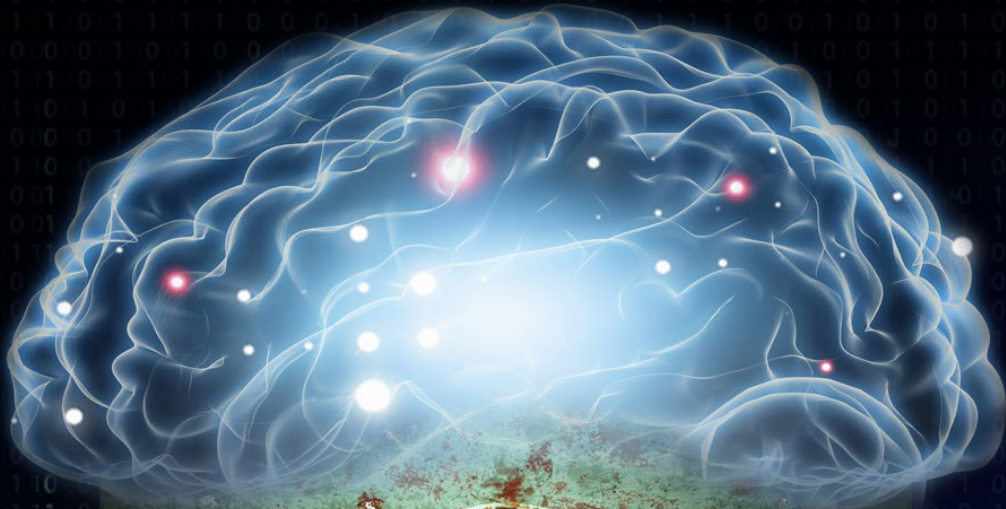

Often the safe key is deposited in a place in your branch that is known to many staff members and also outsiders.

The result: costs of service and key management as well as an increasing risk of losses due to (internal) theft.

The smart safe lock

Due to the right safe lock system you will eliminate almost all the security risks mentioned in the key lock chapter. In addition you are able to view all events happened on your new lock (audit).

With forced input actions clear responsibilities arises which can be traced back to an responsible employee. The time of responsibility is limited and after duty the employee is relieved from this responsibility completely. This creates clarity and relieves other employees from any form of general suspicion.

our seminar rooms we ensure that
your new safe locking system
is perfectly integrated into the
daily work of your employees
responsible for it.

Service hotline

Do you have questions about
your system(s) or need a solution
to a problem? Give us a call
within our opening hours.
We are at your disposal!

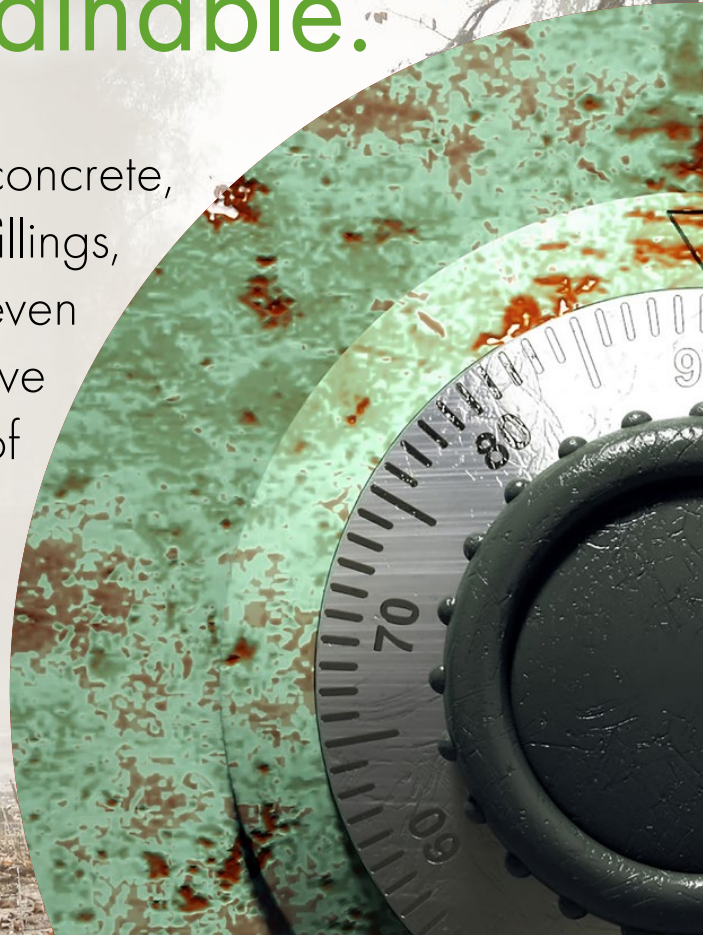

Retrofit specialist
for safes.

... from a single source!

Be sustainable.

Metals, concrete,
heat absorbing fillings,
and sometimes even
asbestos have
to be disposed of
hazardous waste.

Save resources!

Transform your old existing
safes into smart safes.

This protects the environment
and saves resources.

How your business benefits ...

Higher security

Serious security issues associated with handling keys are eliminated. Employees use a six-digit personal code that they can change themselves easily, at any time. User codes can be disabled or deleted by the managers.

Clear responsibility

At any given time there is one single person responsible for the safe. However, the time is limited and after duty the employee is relieved from this responsibility completely. This creates clarity and relieves employees from any form of general suspicion.

View all events happened on your safe lock (audit)

Openings, shift changes and other activities are stored in the lock. You are able to view, save and even download the events.

Cost reduction

Costs for service and key management were eliminated. No broken or lost keys anymore. No hard-turning locks.

Forced input actions

Changing the (cash-)responsibility from one person to another is performed following a fixed procedure right at the safe. It is impossible to give the key to an unauthorized employee.

Alarm connection

The safe can be connected to the alarm system of the store. Employees can trigger a silent signal alarm in case of holdup or distress. Remote blocking is possible through the alarm system.

Time programs

Outside shop hours, the lock can be blocked for some or all employees. Even when a correct code has been entered.

Remote control

Using remote control it is possible to view and manage processes on the lock - even if you are not on site or in your home office.

... due to a smart
safe lock solution.

Don't buy a
new safe!
